# **WHY** WAS THIS STEP IMPORTANT

Organizing the development environment for efficient and well-oriented work from the beginning is not only necessary, but is also one of the keys to ensure smooth workflow and limit avoidable time loss due to inefficient project initialization.

# WHAT WAS THE GOAL

Setting up the development environment (to ensure the project is properly initialized). More precisely, I:

- Installed Python version 3.8.7
- Created a new virtual environment for the app
- Installed the IPython shell package
- Generated a requirements file
- Created the Github repository

# WHY WAS THIS STEP IMPORTANT

Storing recipes as objects with their own data attributes and custom methods can make scripts more efficient and concise, which represent an advantage both for the app execution and code writing.

## WHAT WAS THE GOAL

Building a *Recipe* class with relevant data and procedural attributes. For example:

- An initialization method that takes the name for a recipe and initializes the other data attributes
- A method that automatically calculates recipe difficulty based on users' inputs
- A string representation that prints the entire recipe in a well formatted form

Creating recipes using class methods.

Using class methods to search for recipes according to specific ingredients.

```
C:\WINDOWS\system32\cmd. X + v
(cf-python-base) C:\Users\alexa\Documents\python\recipe-app-cli>python recipe_oop.py

This is all your recipes, in alphabetical order:

Name of the recipe: Banana Smoothie
Cooking time (min): 5
Ingredients: ['Bananas', 'Milk', 'Peanut Butter', 'Sugar', 'Ice Cubes']
Difficulty: medium
Name of the recipe: Cake
Cooking time (min): 50
Ingredients: ['Sugar', 'Butter', 'Eggs', 'Vanilla Essence', 'Flour', 'Baking Powder', 'Milk']
Difficulty: hard
Name of the recipe: Coffee
Cooking time (min): 5

**Creating** the app main menu  
displaying all possible  
operations, and the function for  
each operation

---

## Skills used

---

Research  
Problem solving  
Coding  
Debugging

# **WHY** WAS THIS STEP IMPORTANT

This step was important to ensure that users can easily choose the operation they wish to perform when landing on the main menu, whether it is to create, read, search, edit or delete a recipe.

# WHAT WAS THE GOAL

Implement the app main menu to display to users the 5 possible options: creating a recipe, reading existing ones, searching for recipes based on ingredient(s), editing a recipe, or deleting one. More precisely, the goal was to:

- Implement the function and supporting code for each of the 5 options
- Implement a logic that launched the selected option from the main menu, and then allow users to go back to the main menu when done so they can perform other operations - A while loop has been used for this

# MAIN MENU PRESENTING ALL AVAILABLE OPTIONS

```
Main menu
```

```
-----
```

```
Pick a choice
```

1. Create a new recipe
2. View all recipes
3. Search for a recipe by ingredients
4. Edit a recipe
5. Delete a recipe

```
Type 'quit' to exit
```

```
Your choice (pick a number or type 'quit'):
```

# CODE FOR DISPLAYING MAIN MENU OPTIONS AND REDIRECTING ACCORDINGLY

```
while user_choice != "quit":
    print("Main menu")
    print("-" * 25)
    print("Pick a choice")
    print("1. Create a new recipe")
    print("2. View all recipes")
    print("3. Search for a recipe by ingredients")
    print("4. Edit a recipe")
    print("5. Delete a recipe")
    print("Type 'quit' to exit")
    user_choice = input("Your choice (pick a number or type 'quit'): ")

    if user_choice == "1":
        create_recipe()
        continue
    elif user_choice == "2":
        view_all_recipes()
        continue
    elif user_choice == "3":
        search_by_ingredients()
        continue
    elif user_choice == "4":
        edit_recipe()
        continue
    elif user_choice == "5":
        delete_recipe()
        continue
    elif user_choice.lower() == "quit":
        session.close()
        engine.dispose()
        break
    else:
```

## EXAMPLE - OPTION 2 SELECTED (VIEW ALL RECIPES)

```
-----
Pick a choice
1. Create a new recipe
2. View all recipes
3. Search for a recipe by ingredients
4. Edit a recipe
5. Delete a recipe
Type 'quit' to exit
Your choice (pick a number or type 'quit'): 2
-----

Recipe id: 1
Name of the recipe: tea
Cooking time (min): 5
Ingredients: water, tea
Difficulty: easy
-----
-----

Recipe id: 4
Name of the recipe: pasta bolognese
Cooking time (min): 45
Ingredients: pasta, sauce, cheese, meat
Difficulty: hard
-----
-----
```

## CODE FOR *VIEW ALL RECIPES* OPTION

```
def view_all_recipes():
    try:
        recipes_list = session.query(Recipe).all()
        if not recipes_list:
            print("There are no recipes in the database, you'll therefore be brought back to the main menu")
            return
        else:
            for recipe in recipes_list:
                print(recipe)

        next_action = input("When you want to back to the main menu, simply type 'back': ").lower()
        while next_action != "back":
            next_action = input("Seems like there's a typo. Type 'back' to return to the main menu: ")

        if next_action == "back":
            return

    except:
        print("Something went wrong.")
```

**Creating** a MySQL database  
and **linking it** to the script  
with SQLAlchemy

---

## Skills used

---

Research  
Problem solving  
Code writing  
Debugging

# WHY WAS THIS STEP IMPORTANT

Databases have many advantages. They keep data in a standardized format so they can be stored and accessed more easily, they can be made secure through password access, and it is possible to access them using applications other than Python. Relational Database Management Systems (RDBMS) help to manage databases, and are therefore very useful, especially when dealing with large number of data.

# WHAT WAS THE GOAL

Creating a MySQL database to store data for the Recipe app, and linking it to the script with SQLAlchemy. To do so, I:

- Installed MySQL
- Set up a new user via MySQL command line client (terminal-based interface), and grant it all permissions / privileges when working on databases and their tables
- Created a database in MySQL
- Created a table for the recipes in the created database, with appropriate columns (id, name, ingredients, etc)
- Set up SQLAlchemy, importing it in the script and connected it to the database
- Created an object from the *Session* class, to be able to change the database's contents using an OOP approach rather than SQL queries

Enter password: \*\*\*\*\*  
Welcome to the MySQL monitor. Commands end with ; or \g.  
Your MySQL connection id is 181  
Server version: 8.0.34 MySQL Community Server - GPL

RECIPES IN IT)

## **Implementing** error handling logic

---

### Skills used

---

Research  
Problem solving  
Code writing  
Debugging

# **WHY** WAS THIS STEP IMPORTANT

Some errors occurring when an app is running can prevent scripts from being executed. Even minor errors can make an entire application terminates unexpectedly, which is not ideal and can cause frustration to users. It is therefore crucial to ensure that this type of situation does not happen, by implementing the appropriate codes.

# WHAT WAS THE GOAL

Implementing codes inside the script to catch any possible input errors from users, and display a simple error message explaining how to fix the problem in a clear way, while preventing the application from crashing.

Following this, the code integrity had to be checked by testing each option in the menu (create, updating, search, etc.) with both expected and unexpected values, to see how the app behaves.

For example, if the application were asking users to pick from a set of numbers, and something random was typed like “yes”, it was essential to handle such a scenario to ensure the application would still run.

- To prevent any error to crash the application, *try-except* blocks have been used everywhere users can enter inputs and potentially lead to erroneous values

EXAMPLE OF AN  
INCORRECT  
INPUT AND  
ERROR  
MESSAGE

Debugging

# WHY WAS THIS STEP IMPORTANT

This step was important to simulate the final product with which users would interact, and validate that everything works as it should, particularly at the database level and SQLAlchemy.

# WHAT WAS THE GOAL

- Testing all the options of the application
- Ensuring that it behaves and renders content as it should
- Ensuring that no error causes the application to crash
- Ensuring that the operations carried out in the application are reflected in the database data

```
C:\WINDOWS\system32\cmd. X + v

Critical thinking

# WHY WAS THIS STEP IMPORTANT

Ensuring that the codes are optimized to facilitate possible appropriation by other developers in the future is useful and could possibly save time. It can also facilitate any future adjustments to the codes.

# WHAT WAS THE GOAL

Reviewing the file to make sure everything was optimized as much as possible in order to facilitate future modifications, additions or adjustments.

Adding comments and clarification points in the file where important for the benefit and better understanding of anyone else who may work on this project later.

Formatting the code using Python *Black* package.

# **CHALLENGES** OR SPECIAL POINTS OF CONSIDERATION

I positioned myself from the point of view of future colleagues who could work on this project. How can I make this project and these codes as clear as possible to promote their easy appropriation? I reviewed each file to bring improvements in certain places and add comments where I thought it could be useful.

### Skills used

---

Communication  
Content writing

# WHY WAS THIS STEP IMPORTANT

Ensure the project is well documented and easily accessible by anyone interested.

# WHAT WAS THE GOAL

Updating and completing the README file located in the Recipe app CLI Github repository. The goal was to ensure that all relevant information regarding this project is accessible under these four categories:

- Project description
- User interface
- Technical aspects
- App dependencies

# **CHALLENGES** OR SPECIAL POINTS OF CONSIDERATION

Finding the right balance between giving the right level of information, while remaining as synthetic as possible. To help me, I made a first draft, which I then modified at times. I also drew inspiration from other READMEs I've consulted for similar projects and for which I found that the information presented was relevant.

## **DECISIONS** MADE

I wrote the README documentation from A to Z, in terms of content, presentation and structure.

**README SAMPLE** - FULL VERSION ON GITHUB
